One in Eight New York Bridges "Structurally Deficient"

Federal support needed to maintain safety and limit emergency repair costs of New York's 2,170 deficient bridges

A national report released today shows that New York ranks 17th nationally in terms of the overall condition of the state's bridges, with one being the worst, 51 being the best. [The Fix We're In For 2013](#) finds that drivers in New York are regularly traveling across heavily trafficked bridges rated structurally deficient – bridges that could become dangerous or closed without repair.

The report is the latest update from Transportation for America, which produced a similar report in 2011, based on a national database of bridge inspections maintained by the Federal Highway Administration (FHWA). Advocates from the Tri-State Transportation Campaign responded to the report by calling for increased federal investment in road and bridge maintenance and repair.

Today, one out of every eight bridges that motorists in New York cross each day are likely to be deteriorating to some degree; 12.5 percent of bridges statewide are rated "structurally deficient" according to government standards, compared to 11 percent nationwide.

"The safest and most economically viable approach we can take to New York's infrastructure is to protect the investments we've made with needed safety and structural upgrades," said Nadine Lemmon, Albany Legislative Advocate for the Tri-State Transportation Campaign. "Allowing roads and bridges to slip into disrepair ultimately costs state and local governments billions more than the cost of regular, timely repair. Deferring maintenance of bridges and highways can cost three times as much as preventative repairs."

New York's bridge conditions worsened since the 2011 report, with the number of deficient bridges rising by 61, from 2,109 to 2,170 (out of 17,240 total bridges). The NY State Department of Transportation has adopted a "Preservation First" approach to transportation planning that focuses resources on repair and maintenance.

"New York's 'Preservation First' approach shows that the state is taking its maintenance and repair needs seriously," Lemmon said. "But without increased federal funding, New York will be hard-pressed to meet all of our transportation needs, which include deteriorating bridges, aging public transit, and streets that aren't safe for walking and biking."

Age is a major factor in bridge conditions. Most bridges are designed to last 50 years before major overhaul or replacement; the average age of New York's bridges is 47, and the average age of the state's structurally deficient bridges is 67.

Nearly 67,000 bridges nationwide are classified as "structurally deficient." FHWA estimates that transportation agencies would need \$76 billion to overcome the current backlog of deficient bridges. Without significant federal support, the poor condition of bridges across the country has major implications for safety, mobility and economic activity. American bridges average 43 years old.

Congress has repeatedly declared the condition and safety of our bridges to be of national significance. However, the money to fix them is getting harder to come by with declining gas tax revenues and a fiscal squeeze at all level of government. At the same time, Congress made the prospects for bridges even more uncertain last year by eliminating a dedicated fund for them in its update of the federal transportation program. The new law also reduces access to funds for 90 percent of structurally deficient bridges, most of which are owned by cash-strapped local governments. Now bridges are left to compete with every other priority.

"Preserving New York's existing transportation system is crucial to ensuring regional prosperity, safety and a higher quality of life," said James Corless, director of Transportation for America. "The economic and social cost of neglect is simply too high. It is time for our policymakers to shore up our infrastructure and ensure Americans get the most bang for our transportation buck."

According to the Federal Highway Administration, a structurally deficient bridge is one with "deteriorated conditions of significant bridge elements and potentially reduced load-carrying capacity. A 'structurally deficient' designation does not imply that a bridge is unsafe, but such bridges typically require significant maintenance and repair to remain in service."

The report and an interactive map of deficient bridges is available at <http://t4america.org/resources/bridges/>.

TRANSPORTATION FOR AMERICA (T4) is the largest, most diverse coalition working on transportation reform today. Our nation's transportation network is based on a policy that has not been significantly updated since the 1950's. We believe it is time for a bold new vision — transportation that guarantees our freedom to move however we choose and leads to a stronger economy, greater energy security, cleaner environment, and healthier America for all of us. We're calling for more responsible investment of our federal tax dollars to create a safer, cleaner, smarter transportation system that works for everyone. www.t4america.org

The Tri-State Transportation Campaign is a non-profit organization working toward a more balanced, transit-friendly and equitable transportation system in Connecticut, New York and New Jersey. www.tstc.org
